Lab Review: Successful Path

One successful path:

- ▶ one shared stylesheet
- ▶ readable text
- ▶ consistent navigation
- ▶ intentional color and spacing
- ▶ class-based styling

Today we keep the CSS layer and improve the space.

4

Week 2: One Successful Styled Website Path

Three pages, one shared stylesheet.

One successful path. Not the only answer. It's okay to revise, try again, and keep improving.

Assignment 2 Success Path

5

Review Coding Lab

6

From Styled Page To Organized Page

Styling changes appearance. Layout organizes space.

A styled page may still feel:

- ▶ crowded
- ▶ scattered
- ▶ hard to scan
- ▶ awkward on different screens

Layout makes relationships visible.

7

Styled vs. Organized Layout

Layout is about structure and space, not just decoration.

Styled

Organized

Same content. Better spatial relationships.

From Styled Page To Organized Page

8

What Counts as Success Today

- you can point to the boxes on a page
- you can explain margin, padding, and border
- one Flexbox container changes layout
- the page becomes easier to scan
- you notice what still needs responsive work

9

What We Will Use Today

- ▶ box model
- ▶ layout vocabulary
- ▶ 12-column grid idea
- ▶ content, padding, border, margin
- ▶ container
- ▶ `display: flex`
- ▶ `gap`
- ▶ `flex`
- ▶ save, refresh, resize

10

Today's Beginner Layout Toolbox

The essential tools for building simple, effective layouts.

box model, layout vocabulary, 12-column grid idea, content, padding, border, margin, display: flex, gap, resize test

TODAY'S ACTIVE TOOLS

Today's Toolbox

11

What We Will "Skip" For Now

- ▶ full responsive design strategy
- ▶ many Flexbox properties
- ▶ implementing 960.gs or grid frameworks
- ▶ modern CSS Grid module
- ▶ frameworks like Bootstrap
- ▶ JavaScript behavior

Today: recognize grid thinking; implement one Flexbox layout.

12

Southwest Tech

Week 3: Layout Topics Parked for Later

We're building one step at a time.

Parked for Later

- full responsive strategy
Plan for all screen sizes with a complete approach.
- many Flexbox properties
Explore and practice additional Flexbox controls.
- implementing 960.gs
Use the 960 Grid System to speed up layout.
- modern CSS Grid module
Learn the full power of CSS Grid for layouts.
- frameworks
Use pre-built systems to speed up development.
- JavaScript layout
Add dynamic layout control with JavaScript.

Recognize grid thinking.
Implement one Flexbox layout.

Parked For Later

13

The Box Model Is The First Layout Map

Every element takes up space.

Think of an element as:

- ▶ content: the actual text or image
- ▶ padding: breathing room inside the box
- ▶ border: the edge of the box
- ▶ margin: space outside the box

Layout begins when you can see the boxes.

14

Southwest Tech

The CSS Box Model

Every element is a box.

margin
Space outside the border.

border
The edge around the padding and content.

padding
Space between the content and the border.

content
The text, images, or elements.

Hello, CSS!
This is the content.
It's the text or image inside the box.

Layout begins when you can see the boxes.

Box Model Map

15

Tech

Margin And Padding Are Not The Same

Padding adds space inside the element.
Margin adds space outside the element.

Quick check:

- ▶ text too close to its own edge? padding
- ▶ two boxes too close together? margin or gap
- ▶ layout feels cramped? inspect the space before adding more color

16

Southwest
Tech

Margin vs. Padding

Two kinds of space. Two different jobs.

Padding = space inside

Padding adds space between the content and the edge of the box.

Hello, CSS!

This is some text.

Margin = space outside

Margin adds space outside the box, separating it from other elements.

Hello, CSS!

This is some text.

Inside space and outside space solve different problems.

Margin Versus Padding

Layout Systems In The Reading

Duckett's layout chapter introduces several layout ideas:

- ▶ positioning moves elements from normal flow
- ▶ fixed layouts use set widths
- ▶ liquid layouts stretch with the browser
- ▶ grid systems align content into columns

Read these as vocabulary and history.
Do not try to implement all of them this week.

18

Southwest Tech

Four Layout Ideas from Our Reading

Different ways to organize content on a web page.

1

positioning

Place elements exactly where you want them on the page.

2

fixed layout

Set a specific width. The layout stays the same size.

3

liquid layout

Use percentages. The layout stretches or shrinks with the window.

4

grid system

Use columns to line up content and create consistent layouts.

Read these as layout vocabulary and history.

Layout Systems

19

Grid Thinking, Not Grid Implementation

The 12-column grid idea helps designers plan alignment.

Useful idea:

- ▶ line up content consistently
- ▶ divide space into columns
- ▶ make pages feel organized

This week:

- ▶ recognize the grid-planning idea
- ▶ do not build a 960.gs layout
- ▶ use Flexbox for the lab implementation

20

Southwest Tech

12-Column Grid Thinking

Use a simple grid idea to plan alignment, then build with Flexbox.

12-column grid idea = plan alignment

The grid is a planning guide to keep things aligned and balanced.

960.gs = recognize, do not build today

A classic 12-column CSS framework. Study the idea, not the implementation. Recognize the concept. Don't build the framework.

Flexbox = lab implementation

Use Flexbox to build your layout.

Grid thinking helps planning. Flexbox is today's build tool.

Grid Thinking

21

Containers Control Groups

Flexbox starts with a container.
The container decides how its children line up.

Example:

- ▶ ``.page`` is the container
- ▶ ``.content`` and ``.sidebar`` are children
- ▶ the layout rule goes on ``.page``

22

Flexbox: Parent-Child Idea

The container controls how its children are arranged.

Put the layout rule on the container.

Container Controls Children

23

Flexbox, Gently

Flexbox can organize children in a row or column.
Today's small pattern:

```
.page {
  display: flex;
  gap: 16px;
}
```

Start with one container. Then inspect what changed.

24

25

26

27

Inspect The Result

- ▶ Did the main content and sidebar line up?
- ▶ Is the gap visible?
- ▶ Is the text still readable?
- ▶ What happens when the browser gets narrower?

*Working at one size is progress.
It is not the finish line.*

This Photo by Unknown Author is licensed under CC BY-SA

28

Test Your Layout by Resizing the Browser

Same page. Different width. Same content.

Wide Browser (room to breathe)

Works here

Narrow Browser (squeezed)

Needs refinement here

*Working at one size is progress, not the finish line.
Notice it. Adjust it. Repeat.*

Resize Exposes The Next Problem

29

Lab

Lab: first layout iteration
Use your existing site.

Your goal:

- ▶ choose one section to organize
- ▶ use Flexbox at least once
- ▶ improve spacing or alignment
- ▶ keep navigation usable
- ▶ save evidence of the change

30

Evidence

- ▶ HTML and CSS files still render
- ▶ Flexbox appears in your CSS
- ▶ before/after screenshot if possible
- ▶ one sentence explaining the layout change
- ▶ note one problem you still need to improve

31

Closing Success Check

Today:

- ▶ boxes became visible
- ▶ spacing became intentional
- ▶ one container controlled a group
- ▶ Flexbox created a first layout

Next:

- ▶ *We make layout respond when the screen changes.*

32

Thank you!

Have Fun!
