Core Idea

HTML gives content meaning.

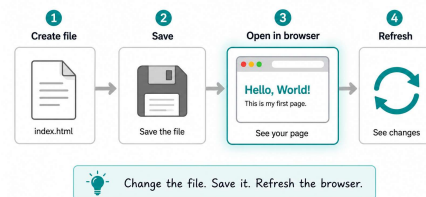

A heading means
"this is a heading."

A paragraph means
"this is body text."

A link means
"go somewhere."

7

The First HTML Development Loop

HTML Dev Loop

8

File To Browser

File -> Save -> Browser -> Refresh

- ▶ The file stores the structure.
- ▶ Save writes your changes.
- ▶ The browser reads the saved file.
- ▶ Refresh shows the latest saved version.

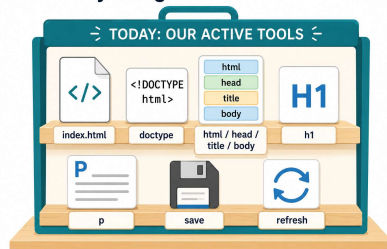

9

What We Will Use Today

- ▶ 'index.html'
- ▶ '<!doctype html>'
- ▶ 'html', 'head', 'title', 'body'
- ▶ 'h1' and 'p'
- ▶ save and refresh

10

Today's Beginner HTML Toolbox

Toolbox

11

What We Will "Skip" For Now

- ▶ CSS will handle appearance.
- ▶ JavaScript will handle behavior.
- ▶ Layout tools will help arrange pages.
- ▶ Frameworks and publishing come much later.

Today,
the win is HTML structure
that opens.

Parked for Later

Week 1 Web Development Foundations

These topics are important. They're just not today.

Useful later. Not today's job.

Parked For Later

13

The Smallest Useful Page

Every first page needs a shape.

- `<!doctype html>` tells the browser what kind of document this is.
- `head` stores page information.
- `body` stores visible content.
- The browser uses the shape to understand the page.

14

Southwest Tech

The Basic Shape of an HTML Document

html
The root element that contains everything.

head
Information about the page (not shown in the browser).

title
The title shown in the browser tab.

body
The visible content of the page (shown in the browser).

h1
A main heading.

p
A paragraph of text.

HTML Document Shape

15

Demo #1

"First Page"

16

Southwest Tech

What to Watch For

- file name: `index.html`
- save before refresh
- browser tab title
- visible page heading

Goal: one page that opens in the browser.

17

Demo: First Page

- Type. Save. Refresh. Observe.
- Type the structure.
- Save the file.
- Open or refresh the browser.
- Change one line and confirm the browser updates.

18

What The Browser Did

- The browser did not guess.
- ▶ `<title>` became the browser tab label.
 - ▶ `<h1>` became the visible page heading.
 - ▶ `<p>` became visible paragraph text.
 - ▶ The result came from the saved HTML structure.

19

Title Versus Heading

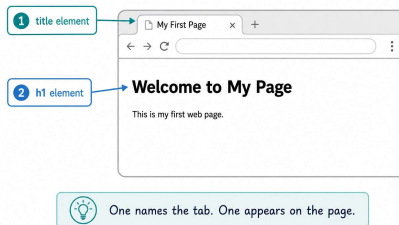

- ▶ `<title>` names the browser tab.
- ▶ `<h1>` names the page content.

Common confusion:

- ▶ The title may not appear inside the page.
- ▶ The heading may not appear in the browser tab.
- ▶ Both are useful, but they do different jobs.

20

Two Different HTML Elements

Title vs. Headings

21

Contrast

Working beats pretty.

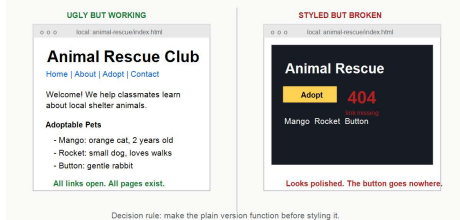

This week, every time.

Prioritize:

- ▶ the file opens
- ▶ the content is structured
- ▶ the links work
- ▶ the page can be changed and refreshed

22

Same student project. Opposite priorities.

Working First!

23

Common Mistakes

Unsaved file

Wrong file name

Broken tag pair

Expecting CSS

"Fix one small thing, then refresh and check again."

24

Southwest
Tech

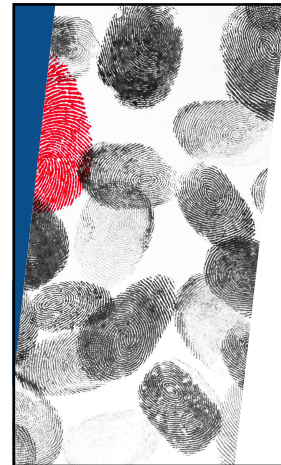

Lab

Start the first page.

- ▶ create the project folder
- ▶ create 'index.html'
- ▶ add a heading and paragraph
- ▶ save, open, refresh, and revise

Do not worry about the full site yet.

25

Southwest
Tech

Evidence

Your initial output should include:

- ▶ your project folder
- ▶ your 'index.html' file
- ▶ a page that opens in the browser
- ▶ notes about what changed

The full reflection comes after the site has been refined.

26

Southwest
Tech

Closing Success Check

If your page opens, and the structure makes sense, you are on track.

Week 1 success is:

- ▶ visible page
- ▶ clear structure
- ▶ saved files
- ▶ working links beginning to form

27

Southwest
Tech

Thank you!

Have Fun!
